- Stylized Mage Pack
- Introduction

This asset provides a complete, ready-to-use characters, VFX, animations, and materials created and optimized for easy integration into your Unity projects.

- Key Features
- Fully rigged male & female characters with 5 pre-made clothing/body/hair/ combinations
- 13+ smooth animations (locomotion, combat, jump, hit, death) – Humanoid setup
- Weapons - Staffs
- Projectiles (4 types), Laser (4 types), and AoE (3 types) spell VFX
- Demo scene fully playable showcasing all features

The documentation is organized as follows:

1. Materials – Setup, naming, clothing split, gender-specific parts, and quick customization tips
2. Animations – FBX structure, rig setup, root motion, loop flags, strafe usage,Mixamo and best practices
3. VFX (Visual Effects) – Folder structure, prefabs, color customization, shader notes, and spawning examples
4. Weapons / Staffs – Prefabs, materials, pearl emission customization, and demo examples
5. Controls & Demo Scene Basics – All input commands used in the demo scene (movement, camera, combat, spells, etc.)

Everything is designed to be plug-and-play while offering clean customization. Start by importing the package and opening the Demo Scene to see it all in action.

Play the Demo Scene in full screen (maximized).

1. **Materials**

To make setup as easy and flexible as possible, all materials are provided on-demand — meaning they are already assigned to the models and prefabs where needed, but you can easily swap or customize them without breaking anything.

- Naming Convention
- Material names match exactly what you see in the project (e.g., M_Female_Body, M_Clothes_01, etc.).
- This makes it simple to identify and reassign materials quickly.
- Important Notes

Clothing Materials (Separated into 01 and 02)

Due to the high number of clothing pieces and UV layout optimization, clothes are split into two separate materials:

- **Clothes_01**
  Covers: Hat, Scarf, Bag, Belt, Gloves
- **Clothes_02**
  Covers: T-Shirt, Pants, Boots

This separation ensures better texture quality and performance. Always assign the correct material to the corresponding mesh parts.

Pre-made Clothing Prefabs

There are already five ready-to-use character prefabs included with different clothing, body, hair, and eye combinations. You can drag and drop them directly.

When customizing, make sure to drag:

- Clothes_01 material → Hat / Scarf / Bag / Belt / Gloves meshes
- Clothes_02 material → T-Shirt / Pants / Boots meshes

Body, Hair & Eyes Materials

- Body, hair, and eye materials are gender-specific (check folder names).
- Female materials (e.g., M_Female_Body) should only be used on the female character model.

- Male materials (e.g., M_Male_Body, M_Male_Hair_XX, M_Male_Eyes) should only be used on the male character model.

Mixing gender-specific materials may cause visual glitches (wrong UV mapping or proportions).

- Quick Setup Tips

1. Open the character prefab (Female or Male variant).
2. In the Hierarchy, select the clothing or body mesh you want to change.
3. In the Inspector → Mesh Renderer → Materials, drag the appropriate material from the project folder.
4. Materials use Standard Shader (Built-in / URP / HDRP compatible versions included — check subfolders if needed).

Everything is set up to be plug-and-play, but the split materials give you full control for custom outfits or texture variations.

If you run into any material assignment issues, feel free to contact support.

2. Animations

All animations are included in a dedicated Animations FBX file for better organization, security, and future updates.

- Important Notes

Do NOT use the **Animations FBX model** directly in your scenes.

- The model inside the Animations FBX exists only as a safe reference structure to preserve the rig hierarchy and bone setup.
- Recommended workflow: **Use the prepared Male or Female FBX models** / prefabs already set up (they come with the correct rig and materials applied).
- This separation allows cleaner updates in the future: visuals in character FBX files, animations in the Animations FBX file.
- Rig Setup
- All animations are configured to work **with Humanoid rig.**

- If the Animations FBX import shows as Generic instead of Humanoid:
    1. Select the Animations FBX in the Project window
    2. Go to Inspector → Rig tab
    3. Set Animation Type to Humanoid
    4. Click Apply

A ready-to-use Humanoid Animator Controller is already included — just assign it to your character prefab.

- Root Motion
- All animations contain root motion data.
- **Root motion is NOT required — none of the animations depend on it to function correctly.**
- Root motion exists mainly to prevent foot sliding or ground sinking.
- **Recommendation: Bake all root transforms to original position** if you notice any issues (optional).
- Loop Settings
- Animations with "_loop" in the name are designed to be looping.
- Make sure Loop Time is enabled in the animation clip Inspector.
- Strafe & Backward Animations
- Strafe (left/right) and walk backward are optimized for lock-on mode only.
- **Do NOT use strafe/backward in free movement — they may look unnatural without a locked target.**
- For normal movement, use standard forward loops plus manual rotation (handled automatically in the demo).

All animations were authored with clean loops, proper naming, no foot sliding, and smooth blending. Ready for any Humanoid setup.

If you experience retargeting or blending issues, contact support — happy to help adjust the Animator Controller or rig.

Regarding Mixamo, to get the best results I highly recommend uploading the default FBX character from Unity to Mixamo. To do this, you can use an FBX exporter in Unity.

It's normal if Mixamo doesn't recognize the character on the first try — just try uploading it again. If the issue persists, I recommend clearing your browser cache.

When downloading the animation from Mixamo, make sure to choose the **FBX for Unity** format.

Important: When you export the animation back to Unity, it's normal for the toe bones (Ball_R or Ball_L) to be assigned incorrectly by Unity. To fix this, open **Configure Avatar** → **Mapping**, scroll down, and check whether the toes are correctly assigned to Ball_R and Ball_L in the proper slots.

Also, if the animation has the arms and legs very spread out (for example, capoeira dancing), the retargeting may not be perfect due to differences in character proportions and limb length.

3. VFX (Visual Effects)

All visual effects are organized in a dedicated VFX folder for easy access and management.

- Folder Structure
- VFX → Contains all particle systems, shaders, materials, and prefabs.
- VFX_Prefabs → Ready-to-use prefabs for projectiles, impacts, laser beams, AoE circles/explosions, etc.
- Important Notes

Shader Graphs & Materials

- Some effects use Shader Graph (URP/HDRP).
- If you don't know Shader Graph, leave everything as default — already set up for good performance and visuals.

Using the VFX Prefabs

- All prefabs in VFX_Prefabs are plug-and-play.

- You will need a script to instantiate them at the right time/position.
- Two simple example scripts are included for hit impact — you can delete or replace them.

Customizing Colors

1. Open the prefab in Project window.
2. Select the Particle System component.
3. In Inspector → Start Color or Color over Lifetime, change the first color modifier.

Optimized for performance and compatible with Built-in, URP, and HDRP.

Use Instantiate(vfxPrefab, position, rotation) in your scripts for full control.

4. Weapons / Staffs

Weapons (magical staffs) are provided as separate prefabs for easy integration and customization.

- Included Prefabs
- Staff_01
- Staff_02
- Staff_03
- Staff_04

Drag them as child of the hand bone or instantiate via script.

- Materials
- Staff_01 and Staff_03 → M_Staffs_01
- Staff_02 and Staff_04 → M_Staffs_02
- Pearl Gems (Emission & Color Customization)

Pearls are left without color on purpose for full freedom.

How to customize pearls:

1. Create a new Lit Material.
2. Enable Emission.
3. Set Emission Color (use HDR intensity for strong glow).
4. Drag the material onto the pearl mesh.

Already scaled and positioned for standard Humanoid rigs. Low-poly and mobile friendly.

5. Controls & Demo Scene Basics

The demo scene showcases all features with simple controls.

- Basic Movement
  WASD → Move
  Left Shift → Sprint
  Space → Jump

- Camera & Targeting
  C → Switch camera
  F → Toggle Lock-On

- Combat & Spells
  Left Mouse Button → Heavy Attack
  Right Mouse Button → Light Attack
  1–4 → Select Light Spell
  5–8 → Select Heavy Spell
  H / J / K → Cast AoE Spells

controls are displayed on-screen in the demo scene.

Test everything: movement, combat, VFX, staffs, animations, camera switch.

Have fun experimenting and adapt the controls to your own Input System.

- Final Notes & Getting Started

1. Import all files from the package.
2. Open the Demo Scene to see everything working.
3. Drag Male/Female prefabs into your own scenes.
4. Created in Unity 6.3 Lts Compatible with Unity 2022.3+ (/ URP / HDRP).
5. For Built-in Render Pipeline:

- The New Input System package must be installed and enabled.
- URP materials must be manually reassigned to Built-in Standard shaders.

If you want to play the demo scene with the female character, disable the male player object, drag the DemoSceneFemalePrefab into the scene, assign her to camera targets, and set projectile spawn points.

Thank you for choosing this asset.

If anything doesn’t work as expected or you need help integrating or customizing, contact support via Unity Asset Store.

Enjoy building your game!
