Stylized Mages Pack v2

This asset provides Stylized **characters** (male and female base meshes), animations, weapons, and materials, all created and optimized for easy integration into your project.

Key Features

- Fully rigged male & female characters with **30+ materials** across clothing, body, hair, and combinations
- **30+ smooth animations** (locomotion, combat, interactions), all configured for humanoid rigs
- Weapon type : Staff

Documentation Overview

The documentation is organized as follows:

1. **Materials** – setup, naming conventions, gender-specific parts, and customization tips
2. **Animations** – FBX structure, rig setup, root motion, loop settings, strafe usage, Mixamo, and best practices
3. **Weapons** – animations and prefabs

Start by importing the package and opening the **Demo Scene** to see everything working in context. (TextMeshPro Required)

---

1. Materials

To make setup as simple and flexible as possible, all materials are provided **directly within the models**.

They are already assigned to the correct meshes and prefabs, but can be easily swapped or customized without breaking anything.

Naming Convention

Material names match exactly what you see in the project (e.g., `m_female_body`, `m_ma_clothes_01`, etc.), making it easy to identify and reassign them quickly.

Pre-made Character Prefabs

Four ready-to-use character prefabs are included, featuring different combinations of:

- Clothing
- Body
- Hair
- Eyes

You can drag and drop them directly into your scene.

Gender-Specific Materials

Body, hair, and eye materials are gender-specific (check folder names).

Example:
`m_af_female_body` should only be used on the female character model.

Mixing gender-specific materials may result in visual issues such as incorrect UV mapping or proportions.

Quick Setup

1. Open a character prefab (male or female variant)
2. In the Hierarchy, select the mesh you want to modify
3. In the Inspector → Mesh Renderer → Materials, assign the desired material

---

2. Animations

All animations are organized into one FBX file for better structure, security, and easier future updates.

Important

DO NOT use the animation FBX model directly in your scene.

The model included in the animation FBX is only a reference used to preserve rig hierarchy and bone structure.

Recommended Workflow

Use the provided male or female character prefabs, which are already correctly set up with:

- Proper rig configuration
- Materials assigned

This separation ensures cleaner updates:

- Character visuals → Character FBX files
- Animations → Animation FBX files

Rig Setup

All character animations are configured for a humanoid rig.

If an animation imports as **Generic** instead of **Humanoid**:

1. Select the animation FBX in the Project window
2. Go to Inspector → Rig
3. Set Animation Type to **Humanoid**
4. Click Apply

---

*Animation Setup Notes
For lock-on locomotion, use the 8-direction locomotion set together with the lock-on attack animations.
For free movement and free aiming, use the standard walk cycle with manual character rotation and the free-aim attack animations, as they were authored with a straight spine.

*Animation Import & Setup
Any animations labeled UpperBody require an Avatar Mask (or upper-body mask) to work correctly. Be sure to create and assign the appropriate mask before using them.

Root Motion

All animations include root motion data.

I highly recommend baking the animations in their original form, since the combat animations were designed and created in-place. This approach makes it easier to control how much the character moves forward during each attack. I also recommend baking the X and Z axes for Combat animations to prevent sliding.”

Loop Settings

Animations with `_Loop` in the name are designed to loop.

Make sure **Loop Time** is enabled in the animation clip Inspector.

---

8 - directions Animations

These animations are designed for **lock-on systems only**.

Do not use them in free movement, as they may look unnatural without a target.

For standard movement, use walk cycles combined with manual rotation

---

4. Sockets & Equipment

- Use `weaponholder_L` and `weaponholder_R` bones
- Attach weapons using empty GameObjects (sockets)

Placement:

- staff → Right Hand
-

Mixamo Workflow

For best results, upload the default Unity FBX character to Mixamo.

- If the character is not detected correctly, try uploading again
- If the issue persists, clear your browser cache

When downloading animations, select:

Format: FBX for Unity

Important (Unity Avatar Fix)

Unity may incorrectly assign toe bones (`Ball_L`, `Ball_R`).

To fix this:

1. Open **Configure Avatar**
2. Go to **Mapping**
3. Verify that `Ball_L` and `Ball_R` are assigned correctly

⚠️ Retargeting Note

Animations with extreme poses (e.g., capoeira-style movements) may not retarget perfectly due to differences in character proportions and limb length.
